

COVID-19: Implications for Pharmacists

Paul Reynolds, PharmD, BCCCP
 Matthew Miller, PharmD, BCIDP
 Gina Moore, PharmD, MBA
 March 20, 2020

UNIVERSITY OF COLORADO
 ANSCHUTZ MEDICAL CAMPUS

Learning Objectives

- Identify the unique clinical and epidemiological characteristics of Coronavirus (COVID-19) in the spectrum of viral clinical illnesses and previous Coronavirus (SARS, MERS) and non-Coronavirus (influenza, common cold) related illnesses
- Describe the epidemiological impact of interventions to reduce spread of disease in the setting of limited healthcare resources
- Summarize common clinical presentations of COVID-19 compared to other cold and influenza related illnesses and describe who should receiving referral for testing
- Analyze emerging literature regarding potential treatment modalities for COVID-19
- Devise potential roles for pharmacists and technicians in a variety of healthcare settings for the management of a COVID-19 pandemic
- List the steps the Colorado Pharmacists Society (CPS) is taking to address COVID-19.
- Describe how CPS is collaborating with other professional pharmacy organizations and state and federal agencies.

Before Our Talk...

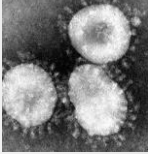

DISCLAIMER

- Information regarding COVID-19 is rapidly evolving
- Quality of data in a pandemic is limited (especially early)
 - Case Series
 - Case Reports
 - Important to separate preliminary information from fact
 - Experimental conditions vs real world data
 - Efficacy of antivirals vs clinical efficacy
- Pharmacist's role:
 - Trusted
 - Source of truth
 - Separate science from theory and opinion

Introduction and Nomenclature

- Coronavirus as a Family of Viruses
 - Positive sense RNA viruses
 - Largest genome of RNA viruses
 - Beta-Coronaviruses most common to infect humans
 - HCoV variants – the common cold (infecting humans for 800 plus years)
 - Mutant variants – SARS-CoV, MERS, SARS-CoV-2/COVID19
- COVID-2019
 - Also known as "coronavirus" or SARS-CoV-2
 - Origination in China (patient zero likely November or December 2019)
 - 76% identical genome to SARS
 - 96% identical genome to Cave Bat CoV

Origins

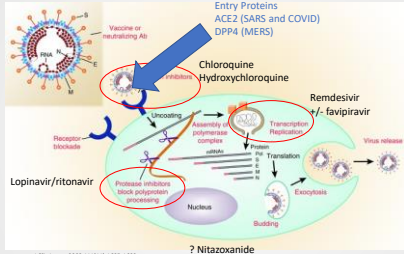

A. SARS
 B. Bat
 C. SARS-CoV-2

Humans
 Humans
 Humans

Pathogens 2020, 9, 186; doi:10.3390/pathogens9030186

Entry Proteins ACE2 (SARS and COVID) DPP4 (MERS)

Chloroquine Hydroxychloroquine

Remdesivir +/- favipiravir

Lopinavir/ritonavir

? Nitazoxanide

© Elsevier. 2020; 11(12):1805-1809. Cell Res. 2020 Mar; 30(3):269-271.

COVID-19 Myth 1: ACE/ARB Treated Patients Do Worse Because of Viral Entry ACE Protein

Answer:
Could Happen But
No Data

ACC/HFSA/ESC say
do not discontinue
to prevent COVID-
19

Few differences in#
hypertensive patients
with mild vs severe
disease

Image source amazon

Why Is COVID-19 So Clinically Relevant?

COVID-19 Has a Basic Reproduction (R_0) number of 2-3

Journal of Travel Medicine, 2020, 1-4

COVID-19 Myth 2: COVID-19 Can Live on Surfaces for Days

Answer 1: **Partially False**

Determined by Inoculum
Size and Half Life on
Object

Steel: 5.6 hours
Plastic: 6.8 hours

Very low inoculum at 72
hours but still there
(same as SARS)

Answer 2:
Droplets are
primary mode of
transmission
(Aerosol Half Life –
1 hour)

Asymptomatic
patients with a
high viral load can
transmit (2 days
before symptoms)

UPDATE ON NEWLY DISCOVERED CORONAVIRUS

	SARS CoV	MERS CoV	SARS-CoV 2
Virion Structure	Enveloped RNA virus	Enveloped RNA virus	Enveloped RNA virus
Outbreak period	2003-2004	2012-present	Dec 2019-present
Initial site of isolation	Guangdong province, China	Saudi Arabia	Wuhan, China
No. of countries/cases	29	27	>70
No. of cases (mortality)	8,096 (9.6%)	2,494 (~34%)	~109,936 (N=3,806)(3.4%)* *6,129 critical (~14%)
No. of cases U.S.	8	2 (2014)	538 (WA, IL, CA, AZ, Mass, Wis)
Reservoir (intermediate host)	Bats (palm civet)	Bats (dromedary camels)	Bats (likely a zoonosis)
Incubation period	2-7 days (range, 2-21)	2-7 (range, 2-14 days)	2-14 days (mean 5-6)
Infectivity, rho	1.8-2.5	0.3-1.3	~3 (2.4-3.8)*
Super spreaders	Yes	Yes (common)	Yes (many examples)
Asymptomatic/mild Spread	No	Rare	Yes/Yes
Attack Rate	10.3% to 60%	4 to 20%	20-30%, 80% (early study)?
Transmission (Including to MCP)	Droplet/Direct, Airborne/Indirect?	Droplet/Direct, Airborne/Indirect?	Droplet/Direct, Airborne/Indirect/Fecal
Treatment (PEP)	Supportive (none)	Supportive (none)	Supportive (drug@UI)
Infection Prevention	Airborne, contact, face shield	Airborne, contact, face shield	Airborne, contact, face shield

* About 83% of cases are mild or asymptomatic. Mortality Rates are age Stratified:

<https://www.cdc.gov/media/releases/2020/s110320-nCoV-2019.html>

Differentiating Symptoms

Symptom/Lab	COVID-19	Influenza	Common Cold
Fever	>80-90% – careful sometimes delayed!	>80-90%	Very Rare
Cough	70% of which majority is dry cough (30% sputum producing)	Often dry	Common – dry or wet
Myalgia/Fatigue	11-50%	Common	Rare
Immune effects	Leukopenia (30-60%) – T cell Depression	Rare	Never
Platelet effects	Thrombocytopenia (40-60%)	Rare	Never
Sneezing	No	Rare	Common
Congestion	No	Rare	Common
Sore Throat	13%	Rare	Common
Hospitalization Rate	4-16% (ICU)	0.03%	Rare
Cause of Death	Acute Respiratory Distress Syndrome (ARDS)	ARDS	Rare

Testing for COVID-19

- What tests are available?
 - Standard of care: Real time rRT-PCR (Nasopharyngeal, oropharyngeal, bronchioalveolar lavage, aspirates, sputum)
 - Alternative testing (in development): IgM ELISA, Point of care testing
- Who to test?
 - At risk individuals with symptoms compatible with COVID-19
 - Hospitalized patients with symptoms compatible with COVID-19
 - Any persons (esp healthcare workers) within 14 days of close contact (from sx onset) of a confirmed COVID-19 patient
- Colorado: Mitigation strategies may go into effect

The Reason for Separation

Therapeutics for COVID-19

No antiviral therapy has proven effects against COVID-19, and none of the following agents have any approved indications for COVID-19

In Vitro Activity

- SARS-CoV-2 EC₅₀ lowest for:
 - Remdesivir (Gilead) – investigational, broadly active against RNA viruses
 - Chloroquine – FDA approved anti-malarial agent
 - CID, 2020: Hydroxychloroquine EC₅₀ = 0.72 μM vs. chloroquine EC₅₀ = 5.5 μM
 - Nitazoxanide – FDA approved anti-parasitic with reported anti-viral effects
- Lopinavir/ritonavir
 - SARS-CoV-1: EC₅₀ = 17 μM
 - EC₅₀ down to 1 μg/mL if ribavirin added
 - HIV EC₅₀ = 0.017-0.102 μM

Clinical Evidence – Chloroquine/hydroxychloroquine

- In vitro data only published
 - Hydroxychloroquine 400mg PO BID x 1 day, then 200mg PO BID x 4 days
 - Chloroquine 500mg PO BID x 5 days
- No published clinical experience to date
- Reports from China (not actual data presented/published)
 - Reduces pneumonia exacerbation
 - Reduces duration of symptoms
 - Improves viral clearance
 - Well-tolerated
- Monitoring – QTc prolongation, GI side effects, retinopathy

Clinical Evidence – Hydroxychloroquine

- Prospective, non-randomized, open-label study
 - Hospitalized with confirmed COVID-19
 - All patients offered hydroxychloroquine (HCQ) 200mg PO TID
 - Those refusing treatment or who met exclusion (allergic to HCQ, retinopathy, QT prolongation, G6PD deficiency) served as untreated controls
 - Antibiotics could be given for treatment/prevention of bacterial infection
 - Primary endpoint = virologic clearance at day 6

Age (years)	Male gender	Clinical status	This study (n=100)		This study (n=100)	
			Mean (SD)	%	Mean (SD)	%
61.2 (16.7)	49 (49%)	Asymptomatic	10 (10%)	10%	10 (10%)	10%
61.2 (16.7)	49 (49%)	Outpatient	10 (10%)	10%	10 (10%)	10%
61.2 (16.7)	49 (49%)	Inpatient	10 (10%)	10%	10 (10%)	10%
61.2 (16.7)	49 (49%)	ICU	10 (10%)	10%	10 (10%)	10%
61.2 (16.7)	49 (49%)	ICU with mechanical ventilation	10 (10%)	10%	10 (10%)	10%
61.2 (16.7)	49 (49%)	ICU with mechanical ventilation and renal replacement therapy	10 (10%)	10%	10 (10%)	10%
61.2 (16.7)	49 (49%)	ICU with mechanical ventilation and renal replacement therapy and extracorporeal membrane oxygenation	10 (10%)	10%	10 (10%)	10%
61.2 (16.7)	49 (49%)	ICU with mechanical ventilation and renal replacement therapy and extracorporeal membrane oxygenation and ECMO	10 (10%)	10%	10 (10%)	10%
61.2 (16.7)	49 (49%)	ICU with mechanical ventilation and renal replacement therapy and extracorporeal membrane oxygenation and ECMO and veno-venous ECMO	10 (10%)	10%	10 (10%)	10%
61.2 (16.7)	49 (49%)	ICU with mechanical ventilation and renal replacement therapy and extracorporeal membrane oxygenation and ECMO and veno-venous ECMO and veno-arterial ECMO	10 (10%)	10%	10 (10%)	10%
61.2 (16.7)	49 (49%)	ICU with mechanical ventilation and renal replacement therapy and extracorporeal membrane oxygenation and ECMO and veno-venous ECMO and veno-arterial ECMO and veno-arterial ECMO with veno-arterial bypass	10 (10%)	10%	10 (10%)	10%
61.2 (16.7)	49 (49%)	ICU with mechanical ventilation and renal replacement therapy and extracorporeal membrane oxygenation and ECMO and veno-venous ECMO and veno-arterial ECMO and veno-arterial ECMO with veno-arterial bypass and veno-arterial bypass with veno-arterial bypass	10 (10%)	10%	10 (10%)	10%
61.2 (16.7)	49 (49%)	ICU with mechanical ventilation and renal replacement therapy and extracorporeal membrane oxygenation and ECMO and veno-venous ECMO and veno-arterial ECMO and veno-arterial ECMO with veno-arterial bypass and veno-arterial bypass with veno-arterial bypass and veno-arterial bypass with veno-arterial bypass	10 (10%)	10%	10 (10%)	10%

Clinical Evidence – Hydroxychloroquine

- Results included 6 HCQ treated patients
 - 3 ICU transfers
 - 1 died
 - 1 left hospital
 - 1 stopped HCQ for GI upset
- Limited data for clinical outcomes
- Unclear role of azithromycin

Figure 2. Percentage of patients with PCR-positive nasopharyngeal swabs from inclusion to Day6 post-inclusion in COVID-19 patients treated with hydroxychloroquine only (n=100) or patients treated with hydroxychloroquine and azithromycin combination, and act COVID-19 control patients.

Ginsberg et al. (2020) Hydroxychloroquine and azithromycin as a treatment of COVID-19: results of an open-label non-randomized clinical trial. International Journal of Antimicrobial Agents – In Press 27 March 2020 – DOI: 10.1016/j.ijant.2020.105949

Ginsberg et al. (2020) Hydroxychloroquine and azithromycin as a treatment of COVID-19: results of an open-label non-randomized clinical trial. International Journal of Antimicrobial Agents – In Press 27 March 2020 – DOI: 10.1016/j.ijant.2020.105949

Clinical Evidence – Hydroxychloroquine

Post-exposure prophylaxis study - HCWs:

Screening Online Questionnaire

- If you are a healthcare worker (HCW) you will have been exposed to COVID-19
- You will be sent an email with information about our prevention study
- At 1PM, we will ask you to take the online screening survey

Medication Shipped

- Study medication will be shipped overnight to your address
- Study medication should arrive by 10 AM
- Take 4 tablets of the study medication with some food or milk

Online Survey (Day 1)

- You will receive an email with a link to an online survey
- Take the second dose of 4 tablets 18 hours after the first
- Take other medication you receive apart from the study medication

Study Days 2-4

- You should stay 1500m from working
- If you develop lower respiratory tract symptoms you may increase the risk to members of household - 14 days
- Take other medication you receive apart from the study medication

Online Survey (Day 5)

- You will receive an email with a link to an online survey
- This should be the same one you took the study medication

End of Study Survey (Day 14)

- You will receive an email with a link to an online survey
- Complete your final questionnaire by completing this study the first time of the trial. There may be further requirements for you
- If you have developed symptoms, do not report to your work, public relations

Clinical Evidence – Lopinavir/ritonavir

SARS-CoV-1

- **Chu et al. 2004:** ARDS or death lower with lopinavir/ritonavir vs. ribavirin alone (2.4% vs. 29%)
 - Retrospective, imbalance in baseline characteristics between groups, lopinavir/ritonavir patients received concomitant ribavirin
 - Rapid viral load decline in lopinavir/ritonavir recipients from nasopharyngeal specimens
- **Chan et al. 2003:** lopinavir/ritonavir plus ribavirin decreased mortality compared to ribavirin alone (2.3% vs. 11%, p < 0.05)
 - Matched, retrospective study. All patients received concomitant corticosteroids as well
 - Rescue therapy with lopinavir/ritonavir not different from matched controls
- **Park et al. 2019:** lopinavir/ritonavir plus ribavirin effective as post-exposure prophylaxis against MERS-CoV

Clinical Evidence

A Trial of Lopinavir–Ritonavir in Adults Hospitalized with Severe Covid-19

- **Open label RCT, published 3/19/2020**
- **Inclusion:** adults with confirmed COVID-19 with radiographic pneumonia and hypoxia (SaO2 < 94% on RA or PaO2:FiO2 < 300)
- **Exclusion:** severe liver dysfunction, HIV, pregnancy, significant interactions
- **Outcomes:**
 - Primary: time to clinical improvement
 - Secondary: clinical status, 28-day mortality, duration of mechanical ventilation, hospital and virologic measures

Clinical Evidence

A Trial of Lopinavir–Ritonavir in Adults Hospitalized with Severe Covid-19

Baseline demographics

Characteristic	Total (N=106)	Lopinavir–Ritonavir (N=50)	Standard Care (N=56)	Difference
Age, median (SD) — yr	58 (16.0)	58 (16.0)	58 (16.0)	0.0
Male sex — no. (%)	103 (97.2)	47 (94.0)	56 (99.8)	0.0
Median length of stay — median (SD)	14 (4.0)	14 (4.0)	14 (4.0)	0.0
Median time to clinical improvement — median (SD)	14 (4.0)	14 (4.0)	14 (4.0)	0.0
Median time to discharge — median (SD)	14 (4.0)	14 (4.0)	14 (4.0)	0.0
Median time to death — median (SD)	14 (4.0)	14 (4.0)	14 (4.0)	0.0

Clinical Evidence

A Trial of Lopinavir–Ritonavir in Adults Hospitalized with Severe Covid-19

- **Outcomes:**
 - Lower rate of serious AEs

Table 1. Outcomes in the Intention-to-Treat Population*

Characteristic	Total (N=106)	Lopinavir–Ritonavir (N=50)	Standard Care (N=56)	Difference
Time to clinical improvement — median no. of days (SD)	14.0 (3.9)	14.0 (3.9)	14.0 (3.9)	0.0
Time to discharge — median no. of days (SD)	14.0 (3.9)	14.0 (3.9)	14.0 (3.9)	0.0
Time to death — median no. of days (SD)	14.0 (3.9)	14.0 (3.9)	14.0 (3.9)	0.0
Time to serious adverse event — median no. of days (SD)	14.0 (3.9)	14.0 (3.9)	14.0 (3.9)	0.0

Clinical Evidence - Remdesivir

- **Appears effective against Ebola**
- **Clinical studies lacking for SARS-CoV-2**
- **Ongoing clinical trials**
 - U.S. = 3 studies (1 NIAID and 2 Gilead sponsored)
 - China = 2 studies
- **Dosing** – 200mg IV load, then 100mg IV daily x 5-10 days
- **Safety:** mostly GI and liver-related effects to date reported
 - IV contains cyclodextrin (SBECD)

Remdesivir

Compassionate use available (<https://rdvcu.gilead.com/>)

The following patient criteria must currently be met in order to submit a compassionate use request for remdesivir:

Key Inclusion criteria:

- Hospitalization
- Confirmed SARS-CoV-2 by PCR
- Invasive or Intubated or Tracheostomy Mechanical Ventilation

Key Exclusion criteria:

- Evidence of Multi-organ failure
- Pressure requirement to maintain blood pressure
- ALT levels > 5 X ULN
- Cr Clearance < 30 mL/min or dialysis or Continuous Veno-Venous Hemofiltration

Hyperinflammation

- Subset of COVID-19 progress to hyperinflammatory state
 - High, persistent fever
 - Cytopenias
 - Hyperferritinemia
 - Increased IL-6, CRP, and d-dimer
- Screening – Hscore for probability of secondary HLH
- Immunosuppression - tocilizumab

Mehra P, et al. Lancet. 2020. epub - DOI: [https://doi.org/10.1016/S0140-6736\(20\)30628-0](https://doi.org/10.1016/S0140-6736(20)30628-0)
 Huang C, et al. Lancet. 2020. epub - DOI: [https://doi.org/10.1016/S0140-6736\(20\)30483-6](https://doi.org/10.1016/S0140-6736(20)30483-6)

Clinical Evidence – Tocilizumab

- Observational study from China, n=21
- Standard of care + Tocilizumab 400mg IV single dose
 - n=3 had repeat dose within 12 hours
- Severe (81%) and critical disease (19%) at time of treatment
 - Severe = RR ≥ 30, SpO2 < 94% on RA, or PaO2:FIO2 ≤ 300
 - Critical = mechanically ventilated, shock, other organ failure
- All 21 survived, 91% discharged
 - Only 10% were mechanically ventilated

<http://www.chinacx.org/DownloadForm?ID=20201810000001>

Clinical Evidence - Others

- Nitazoxanide – in vitro only to date
- Interferon – in vitro and limited clinical experience from SARS-CoV-1 and MERS-CoV (combined with other agents)
- Statins – anti-inflammatory mechanism – theoretical presently and no published evidence of direct benefit for COVID-19
- IVIg – not expected to be effective, pooled sources unlikely to have any sufficient anti-SARS-CoV-2 neutralizing antibodies
- Corticosteroids – unclear role, likely beneficial during later stages of infection where inflammatory response increased

Cell. Res. 2020; 30 (5): 269-271.

Clinical Evidence – Vaccine

NEWS RELEASES

Monday, March 16, 2020

NIH clinical trial of investigational vaccine for COVID-19 begins

Study enrolling Seattle-based healthy adult volunteers.

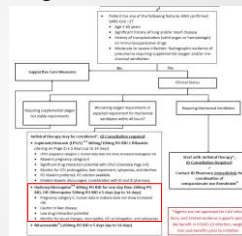

Trials to begin on Covid-19 vaccine in UK next month

Researchers hope to conduct animal tests next week and safety trials as early as next month

- Coronavirus - latest updates
- See all our coronavirus coverage

Proposed Management Algorithm

- No approved or proven treatment of COVID-19 to date
- Limited evidence may support trial of off-label agents with possible anti-viral activity (rapidly evolving, keep up to date)
- Challenges – diagnostic delays, shortages, and low quality evidence to date

Pharmacist Involvement

- Strategies to limit healthcare exposure of patients not suffering from COVID-19
- Inventory control and resource conservation
- Treatment pathway development and resource for critical evaluation of related evidence for novel therapies to manage COVID-19
- Navigation of clinical trials/compassionate use of investigational therapies
- Problem solving around supportive care measures

EIND Process

- <https://www.fda.gov/drugs/investigational-new-drug-ind-application/emergency-investigational-new-drug-eind-applications-antiviral-products>
- Step 1: contact company with investigational product to obtain approval for compassionate use
- Step 2: contact FDA for approval to use investigational product
- Step 3: if FDA approves, reach back out to company and coordinate with pharmacy and local IRB

Social Media and Misinformation

NEWS

Covid-19: ibuprofen should not be used for managing symptoms, say doctors and scientists

EMA gives advice on the use of non-steroidal anti-inflammatories for COVID-19

Press release 18/03/2020

EMA is aware of reports, especially on social media, which raise questions about whether non-steroidal anti-inflammatory medicines (NSAIDs) such as ibuprofen could worsen coronavirus disease (COVID-19).

There is currently no scientific evidence establishing a link between ibuprofen use and severity of COVID-19. EMA is monitoring the situation closely and will review any new information that becomes available in line with the control of the product.

What is CPS doing?

- Letter to the governor asking for emergency measures (sent March 13th)
 - Remote pharmacy practice – remove requirements for prior board approval
 - Allow 90 day supplies of chronic medications
 - Extend technician certification deadlines
 - Allow the CMO of CDPHE to allow pharmacists to provide designated services for:
 - Testing
 - Screening
 - Prescribing (standing order or CPA)

What is CPS doing?

- Community forum for COVID-19
 - Childcare options for healthcare workers
 - Clinical trial information (post-COVID exposure prophylaxis)
- Dedicated web page
- Social media posts (follow us!)

National professional organizations

- NACDS policy requests (partial list)
 - In anticipation of a COVID-19 vaccine, making sure pharmacists may access and immunize without barriers
 - Allowing pharmacists and techs to work across state lines
 - Broader prescriptive authority for mild ailments
 - Allowing remote verification of prescriptions
- NASPA
 - Regular communication regarding activities in other states

Questions and Answers
